

Medication Administration Demonstration Pretest Component Trainer Instructions May 2020

Process

During or after completion of MAP Certification training, the MAP Trainer will evaluate each staff's competency demonstrating the medication administration process.

A medication administration scenario will be presented to staff including a person's name, the time and the date.

The medication used must be a regularly scheduled countable controlled medication packaged in a blister pack.

Ideally staff will have at least two regularly scheduled countable controlled medications listed on the medication sheet with only one of the two being the correct medication to administer based on the scenario presented to staff.

After the medication administration process is demonstrated, documentation must be completed using a

- mock medication book (containing the HCP order, medication sheet and medication information sheet) and a
- mock Count Book (including an index, count sheet and count signature sheet.)

Scoring

There are 12 boxes in the corresponding medication administration demonstration checklist used to evaluate staff competency. Passing is considered 10 boxes 'checked' out of the 12 possible boxes.

Staff must know, in order to be successful, they must continue to practice from the time the training program ends up to their skills test date.
